

DaktarSetu — *Privacy Policy*

Effective date: | Applies to: App v0.3.0, TEST & PRODUCTION

This policy covers the DaktarSetu clinic-management app: who we are, what a clinic and its staff share with us, what a clinic's patients have shared with the clinic, and where each piece of that information actually goes.

1. Who this policy covers

DaktarSetu is an app clinics use to manage patients, appointments, visits, notes, payments and WhatsApp reminders. This policy describes what happens to information handled by the app, whether you're a clinic owner, a staff member a clinic has added, or a patient whose details a clinic has entered.

DaktarSetu is built and operated by Daktarsetu,kapadwanj,Gujarat,india 387620

2. Who controls the data

Every patient record belongs to one clinic. The app enforces this in the database itself, not just on screen: no clinic's staff, and no DaktarSetu administrator working inside the ordinary app, can query another clinic's patients. Records are never pooled or searched across clinics.

In data-protection terms, each clinic is the data controller of its own patients' information.

DaktarSetu is a data processor, acting on that clinic's instructions to store, organise and (where the clinic has enabled it) send WhatsApp reminders on the clinic's behalf.

If you are a patient, your clinic — not DaktarSetu — is who decided to keep your records in this app, and who you should contact first about them. If you are a clinic owner, you are that controller for your own patients.

3. What information exists in the app

Clinic owner & staff accounts

Name, email address, phone number, and (for staff accounts a clinic creates) a temporary sign-in password issued by the clinic, not chosen by the app. If a clinic owner signs in with Google, DaktarSetu asks Google only for name, profile picture and email address — nothing else about the Google account.

Patients (entered by a clinic)

Name, mobile number, date of birth or age, gender, address, and preferred reminder language.

Clinical & operational records

Visit notes written by clinic staff, appointment and visit timestamps, which doctor a patient saw, and payment amounts, mode and status tied to a patient.

Messages

The rendered text of appointment and payment reminders sent by WhatsApp — see section 5 for exactly what that contains.

Technical data

Crash reports and app-performance data, with direct identifiers (names, phone numbers, message contents, email addresses) stripped out before they leave the device — see section 6.

4. How this information is used

- Running the clinic's day-to-day work: registering patients, booking and recording visits, tracking payments and specialist referrals.
- Sending appointment and payment reminders by WhatsApp, only for patients who have not opted out.
- Signing staff in, and limiting what each person can see or do to their own clinic and their assigned role.
- Keeping a record of who viewed or changed a patient's file, for the clinic's own audit trail.
- Diagnosing crashes and slow screens, using data that has already had names, numbers and message text removed.

DaktarSetu does not sell information, and does not use patient information to advertise to patients.

5. WhatsApp reminders

When a clinic turns reminders on, a message goes out from the clinic's own WhatsApp Business number, not a shared or DaktarSetu number. A typical reminder includes: the patient's name, the clinic's name, the doctor's name, and the appointment date and time. A payment reminder additionally names the amount owed.

This only happens for a patient who has not withdrawn consent for WhatsApp reminders. Withdrawing consent immediately cancels any reminder already queued for that patient.

6. Who else sees this information

DaktarSetu relies on a small number of specialist providers to run the app. None of them are permitted to use this data for their own purposes.

Provider	Role	What they receive
Supabase	Hosting & database	Stores every record in the app. Hosting region: Mumbai, India (ap-south-1).
WhatsApp Business	Messaging	Delivers reminder messages sent from a clinic's own WhatsApp Business number.
Sentry	Diagnostics	Crash and performance reports, with names, phone numbers, message text and emails already removed.

Google Sign-In	Sign-in	Used only when a clinic owner chooses to sign in with Google. Shares name, photo and email with the app.
----------------	---------	--

We may also disclose information where required by Indian law, or to protect the rights, safety or property of DoktorSetu, a clinic, or a patient.

7. Access & security

- Row-level access rules in the database mean staff can only reach the clinic they belong to — enforced by the database itself, not just by the screens the app shows.
- Every view or change to a patient's record is logged with who did it and when, for the clinic's own review.
- Staff sign-in credentials are issued by the clinic and must be changed on first use.
- Data in transit between the app and our servers is encrypted.

8. How long information is kept

Each clinic sets its own retention periods; the figures below are the defaults a new clinic starts with, chosen to line up with typical Indian medical record-keeping expectations.

Record type	Kept for
Patient records	2,555 days (~7 years)
Financial / payment records	2,920 days (~8 years)
Appointment records	1,095 days (~3 years)
Audit logs	2,555 days (~7 years)

A patient record is only removed once every record tied to it has passed its own retention period — a recent payment or visit keeps the whole file in place even if the patient record itself is old. Removal is a deliberate clinic action, not an automatic nightly job.

9. Your choices & rights

These already exist as real features in the app, not just intentions:

- **Consent, by category.** A patient's consent for WhatsApp reminders, payment reminders, and general data sharing are recorded and can be withdrawn separately.

- **Export.** A clinic can pull a complete export of a patient's own data — profile, visits, appointments, payments, reminders and consent history — as a single record.
- **Correction & deletion.** A clinic can request a patient's record be corrected or removed. Removal completes immediately if no financial or clinical record still needs to be retained; otherwise it's held for review until those retention periods pass.
- **Ask your clinic first.** Because your clinic controls your data, requests about a specific patient's information should go to that clinic. DoktorSetu supports the clinic in carrying the request out.

10. Minors' information

Clinics can enter a date of birth for a patient of any age, including children, because clinics treat patients of all ages. Where a patient is a minor, it is the clinic's responsibility to have obtained appropriate consent from a parent or guardian before entering that patient's details, in line with Indian law on processing a child's personal data.

11. Changes to this policy

If this policy changes in a way that matters — a new third-party provider, a new use of information — clinic owners and staff are shown an updated notice in the app and asked to acknowledge it before continuing to use DoktorSetu.

12. Contact & grievances

Questions about this policy, or a grievance under India's Digital Personal Data Protection Act, 2023, can be sent to:
